**<sup>2</sup>U.S. Army Corps of Engineers**

**<sup>3</sup>Coastal Protection and Restoration Authority of Louisiana**

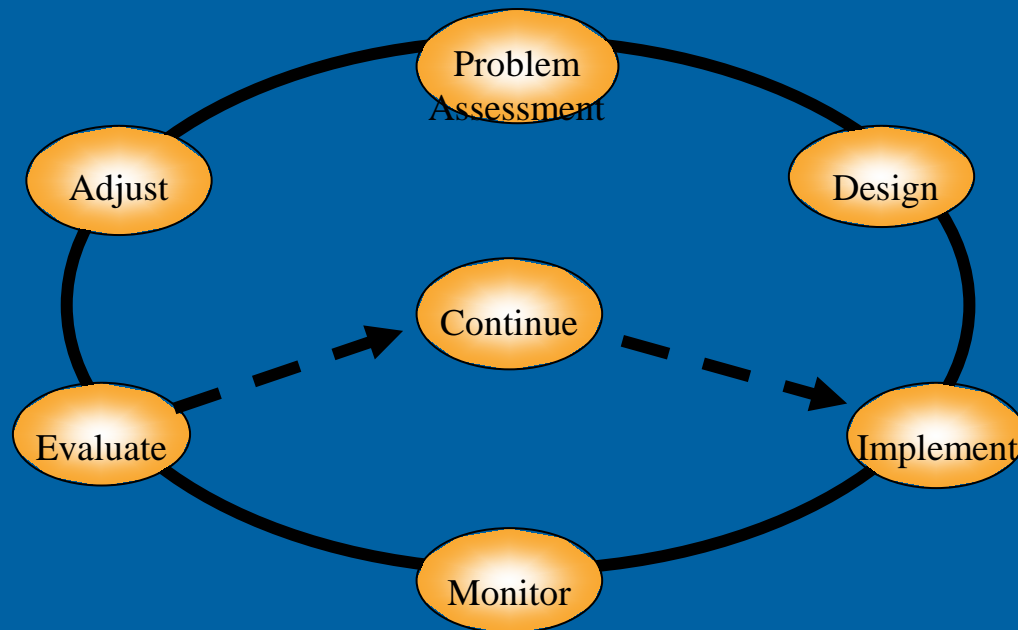

# Outline

- Introduction to Adaptive Management (AM)
- Adaptive Management Framework
- Monitoring and Modeling Advancements
- Investing in an Adaptive Management Strategy

# What is Adaptive Management?

- Adaptive management is an organized and documented undertaking of goal-directed actions, while evaluating their results to determine future actions.
- Simply stated, adaptive management is doing, while learning in the face of uncertain outcomes.

According to the National Research Council's 2004 Adaptive Management for Water Resources Project Planning, "Adaptive management promotes flexible decision making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood.

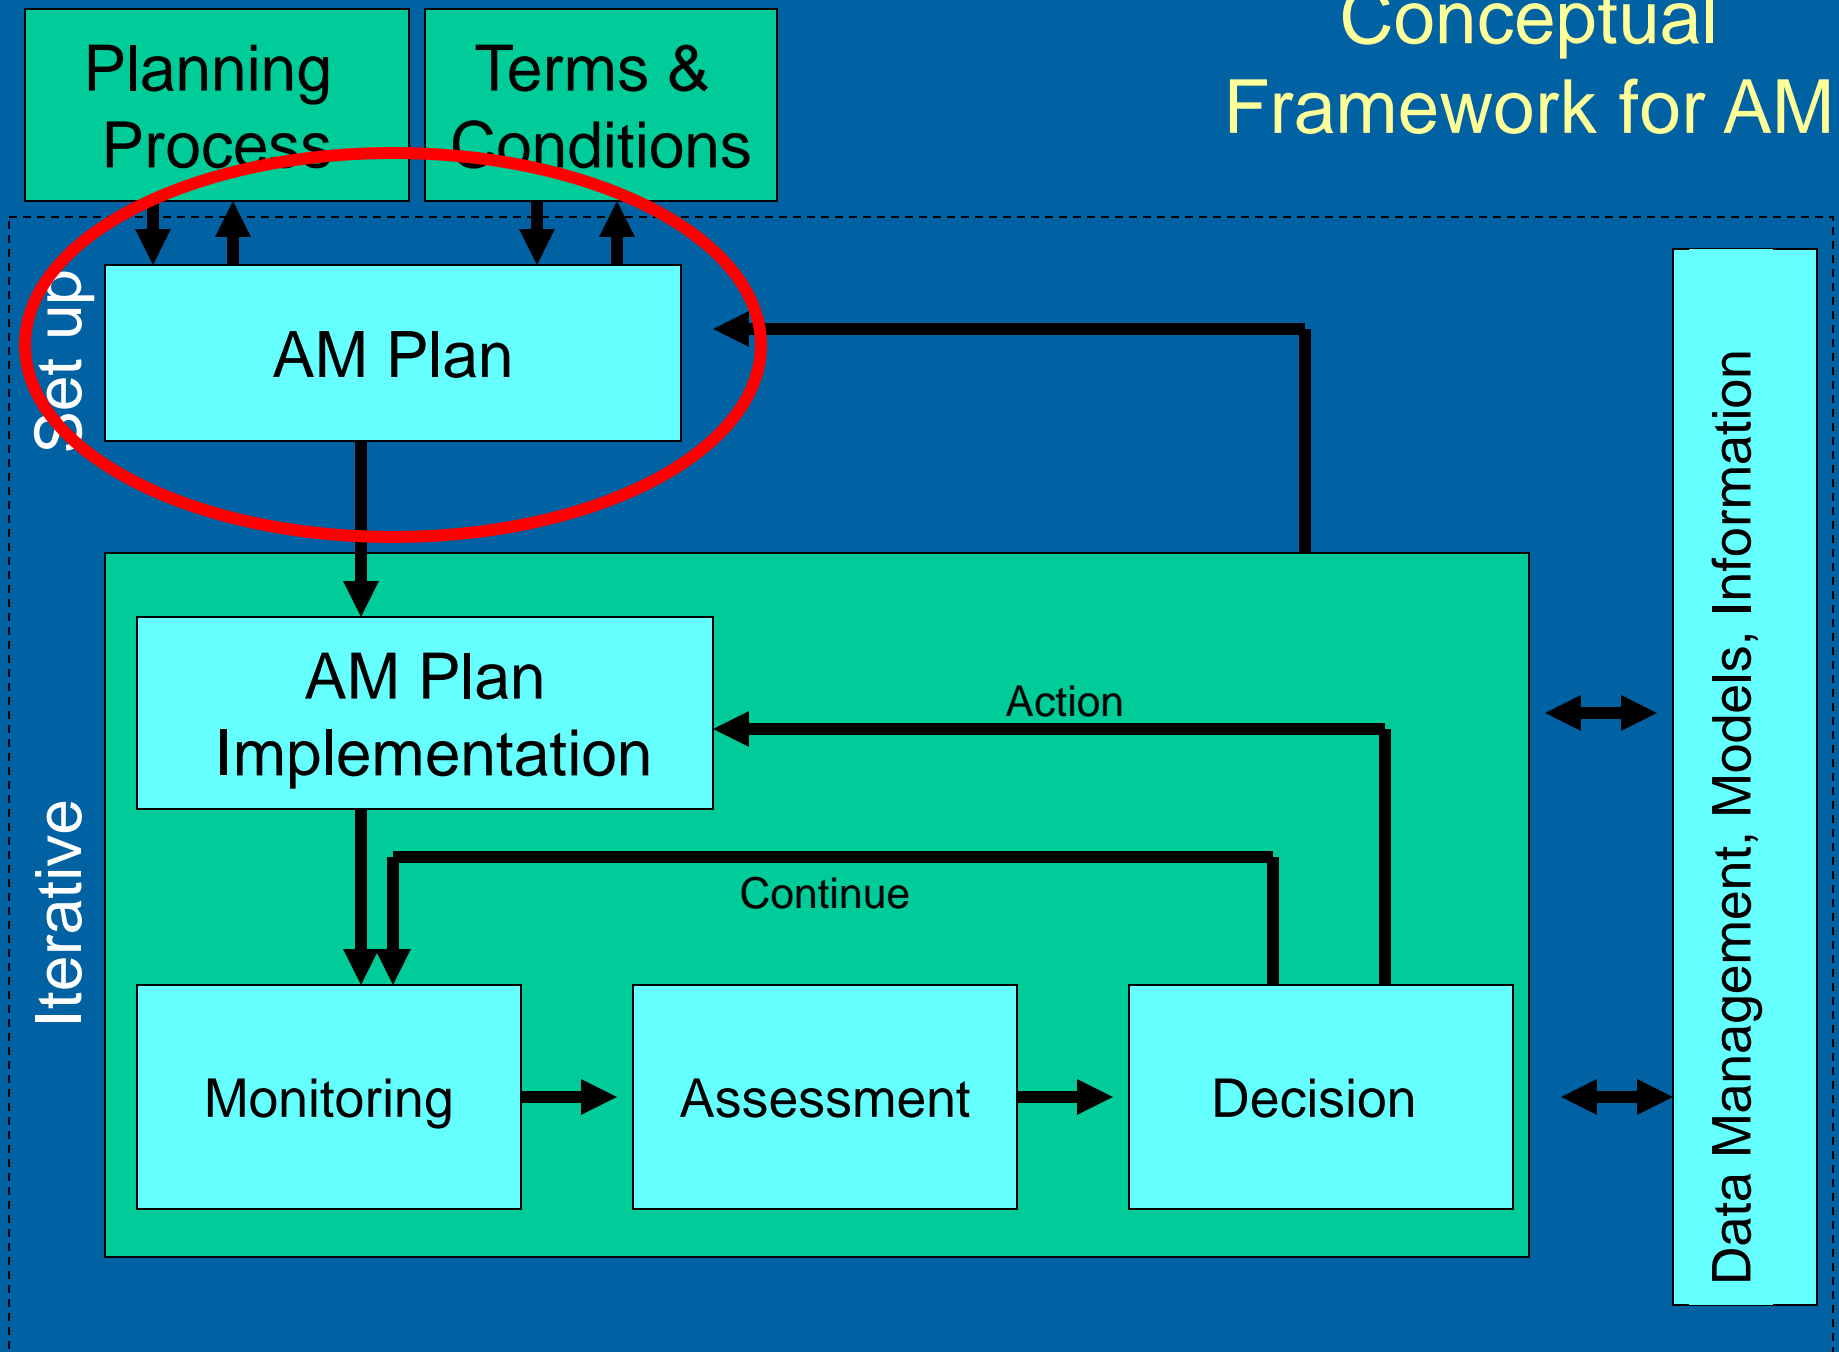

# Adaptive Management Involves

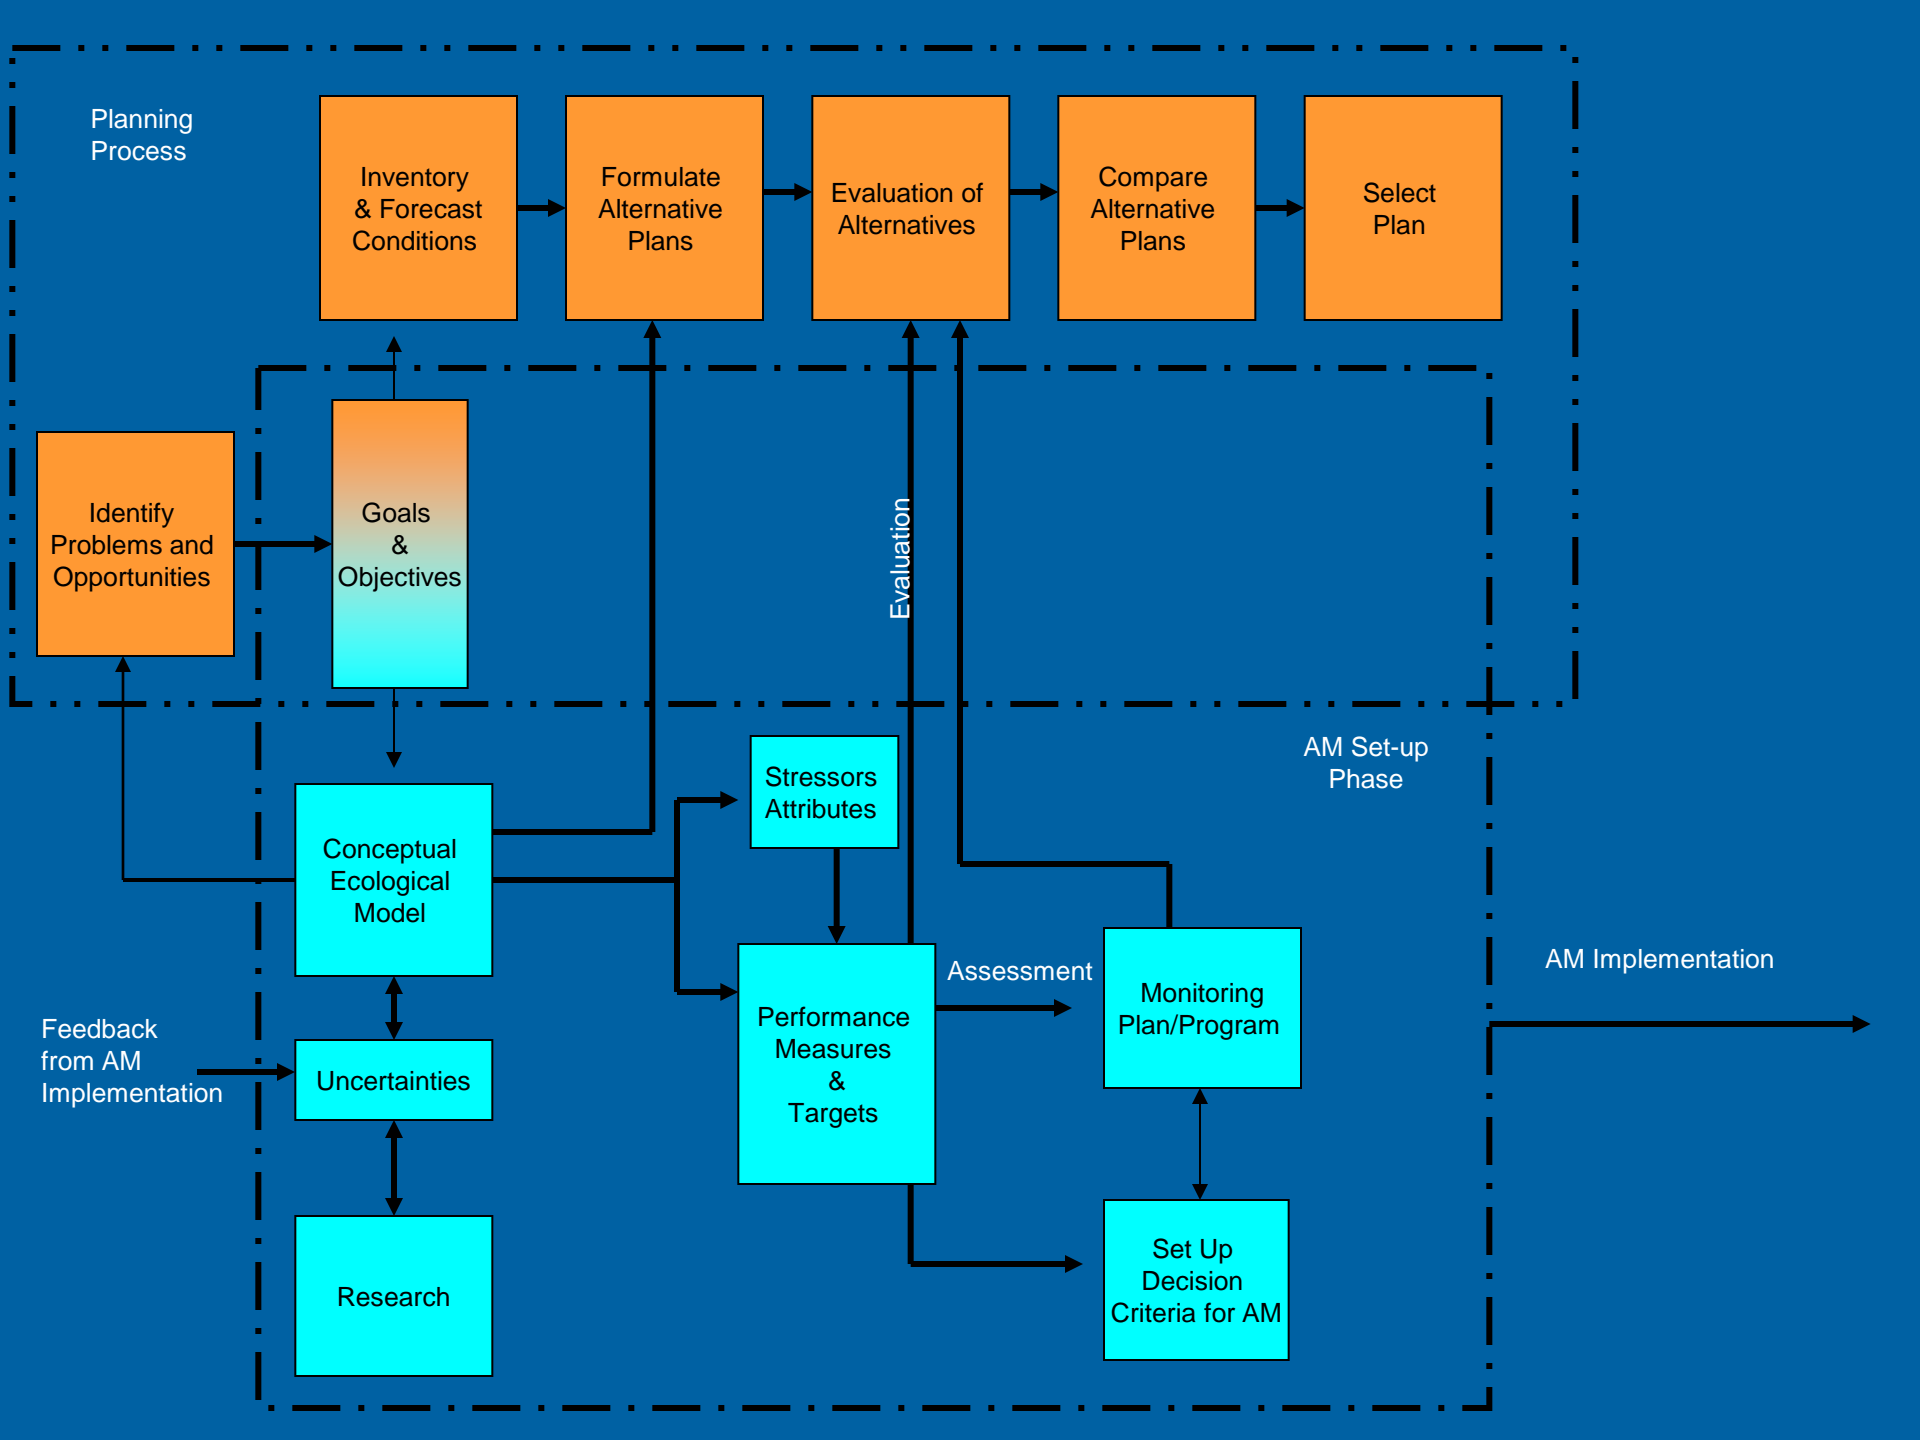

- Exploring alternative ways to meet management objectives
- Identifying uncertainties
- Predicting the outcomes of alternatives based on current state of knowledge
- Implementing one or more of these alternatives
- Monitoring to learn about impacts of management actions
- Using monitoring results to update knowledge and adjust management actions

# **Adaptive Management Framework**

## **Set-up and Implementation**

# Conceptual Framework for AM

# So How Do You Manage Uncertainty through an AM Framework?

- ❑ Conceptual Models
- ❑ Monitoring Programs
- ❑ Hydrological and Ecological Forecasting Models
- ❑ Research
- ❑ Demonstration projects
- ❑ Decision Support Tools
- ❑ Assessment Process

# Monitoring & Modeling Advancements

# Monitoring in a Systems Context

Pre-CRMS

Post-CRMS

# Monitoring Advancements

- 390 CRMS sites – 2006 data collection began

- Project and reference network

- Sites in swamp, fresh, intermediate, brackish, and salt marsh

- Consistent suite of sampling: landscape, vegetation, hydrology, soils at each site

- Assess at site, project, basin and coastwide scales

- Optimize monitoring network to support model development and validation

- Assess system variability

## Questions to address through CRMS:

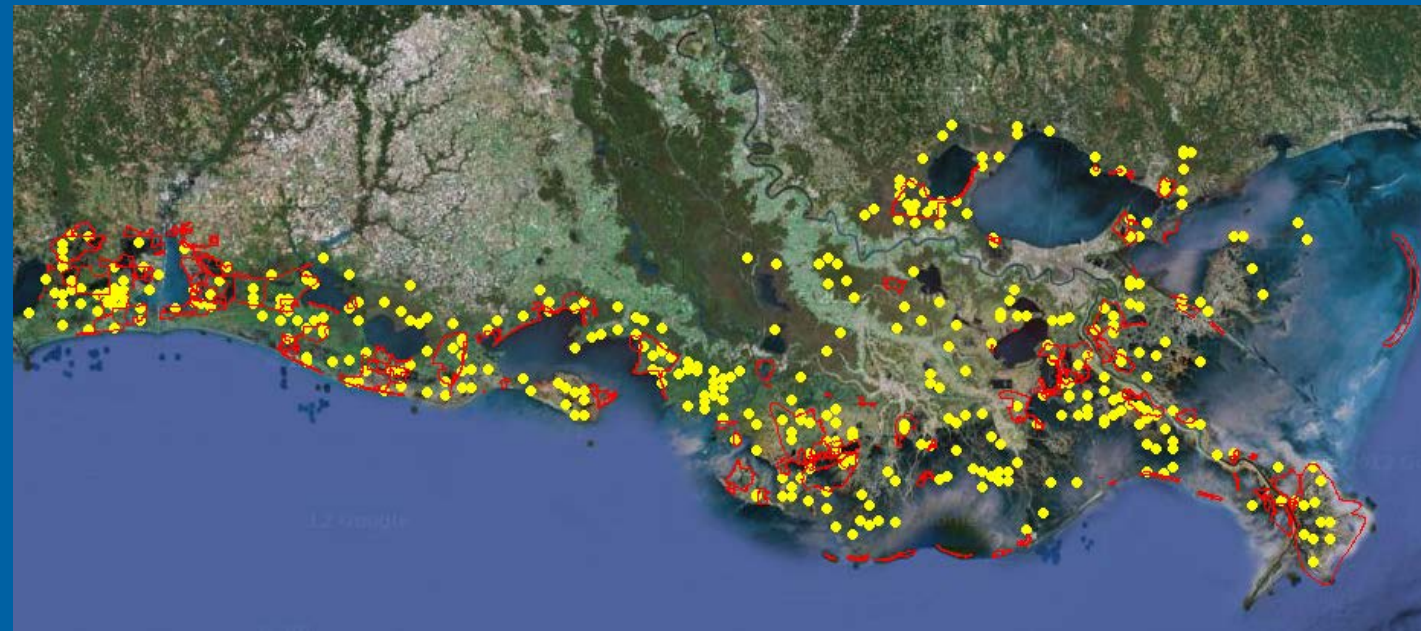

Did the restoration program:

reduce coastal wetland loss?

sustain a diversity of vegetation types within basins?

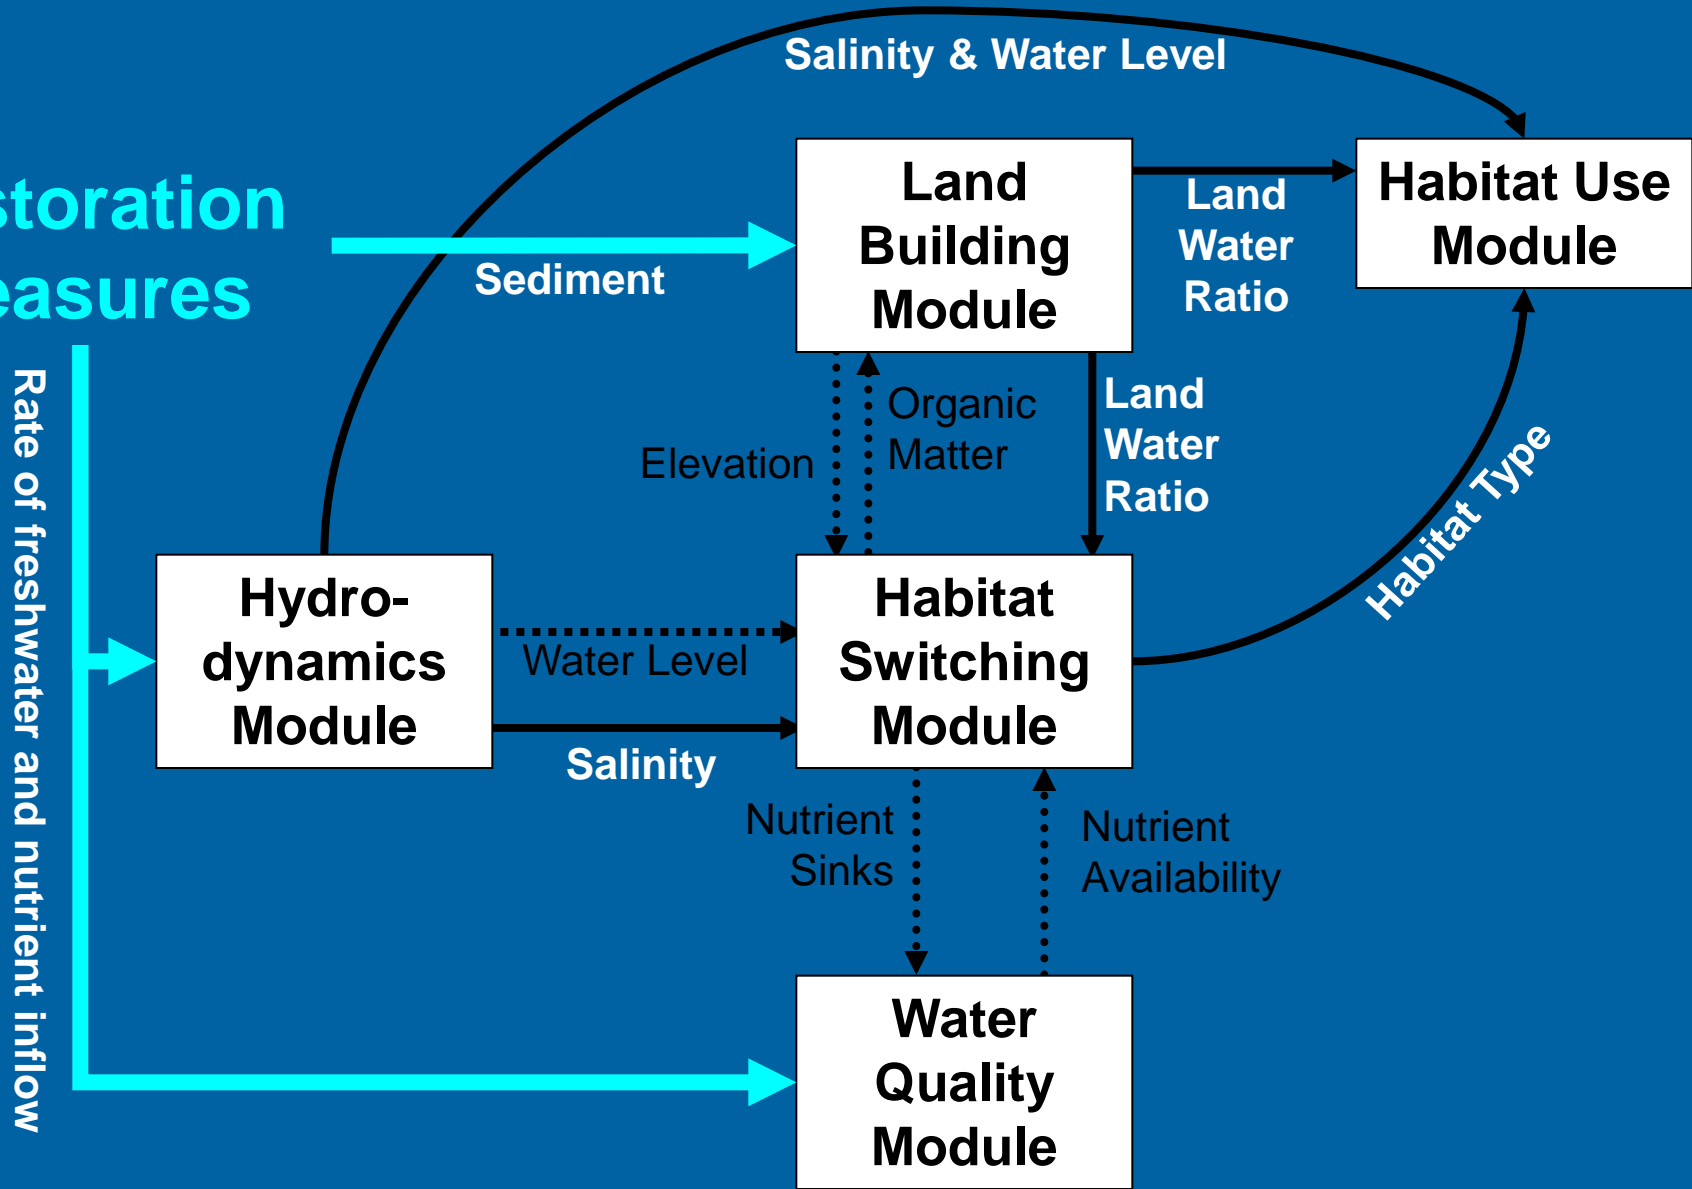

reduce major stressors on wetlands?

Which project types are the most effective in creating, restoring, protecting and enhancing wetlands?

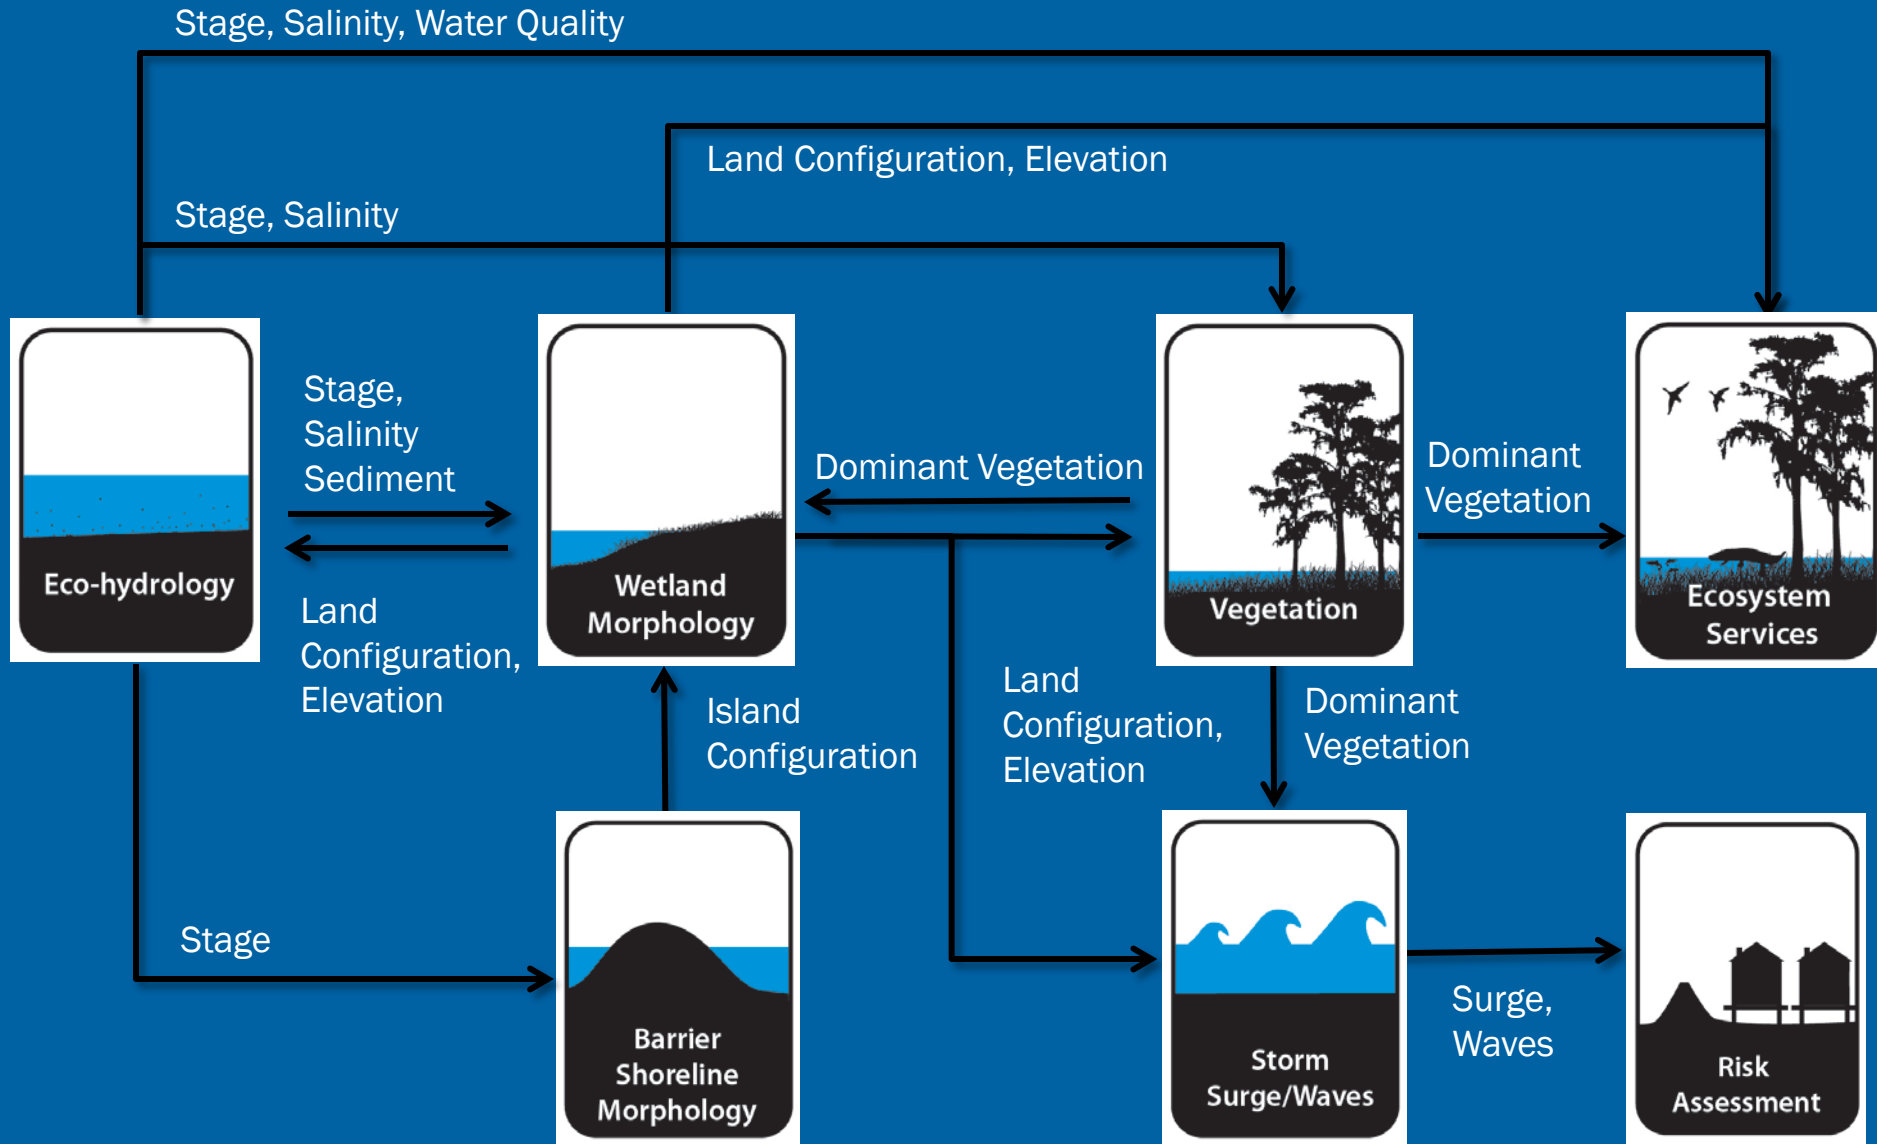

# Modeling in a Systems Context – LCA/CLEAR 2003

## Restoration Measures

# Modeling in a Systems Context - 2012

Input Source	2003 Scientific Rigor	Confidence in Input Source	2012 Status
Salinity	Low	Moderate	↑
Water Levels	High	Moderate	↑
Water Velocities	High	Moderate	→
Water Temperature	Low	Moderate	↗
Flooding Frequency	Low	Low	↗
Sediment Transport	Low	Low	→
Water Residence Time	Moderate	Low	↗
Sediment Input	Moderate	Moderate	↗
Sediment Retention	Low	Moderate	↗
Bulk Density of Deposited Sediment	High	Moderate	↗
Volume of Receiving Basin	Moderate	Low	↑
Nutrient Input	Low	Low	→
Historic Land Change	Moderate	Moderate	↑
Wetland Area	High	Moderate	↑
Vegetation Habitat	High	Moderate	↗

# Vegetation Classification

Used CRMS and remote sensed data to classify 19 dominant species classes: Mangrove, Oystergrass, Saltgrass, Needlerush, Brackish mix, Wiregrass, Paspalum, Bullwhip, Roseau cane, Shrub-scrub, Swamp forest, Delta splay, Bulltongue, Thin mat, Maidencane, Sawgrass, Cattail, Cutgrass, Wax myrtle

Previously was only able to classify by habitat types such as fresh, intermediate, brackish and saline marsh, swamp, bottomland hardwood

# Bathymetry/Topography

DRAFT

U.S. Department of the Interior  
U.S. Geological Survey

Integrated Bathymetry and Topography in the northern  
Gulf of Mexico

By Brady S. Crowlton, Nathan Truhler, Kirby Lord

Figure 2. To be added.

Figure 3. To be added.

Used updated Lidar and bathymetry data to classify landscape. In 2003, an assumption was made that all interior water depths were 0.5m and all coastal nearshore waters were 1.5m – affects volume of receiving basin

# Bulk Density

U.S. Department of the Interior  
U.S. Geological Survey

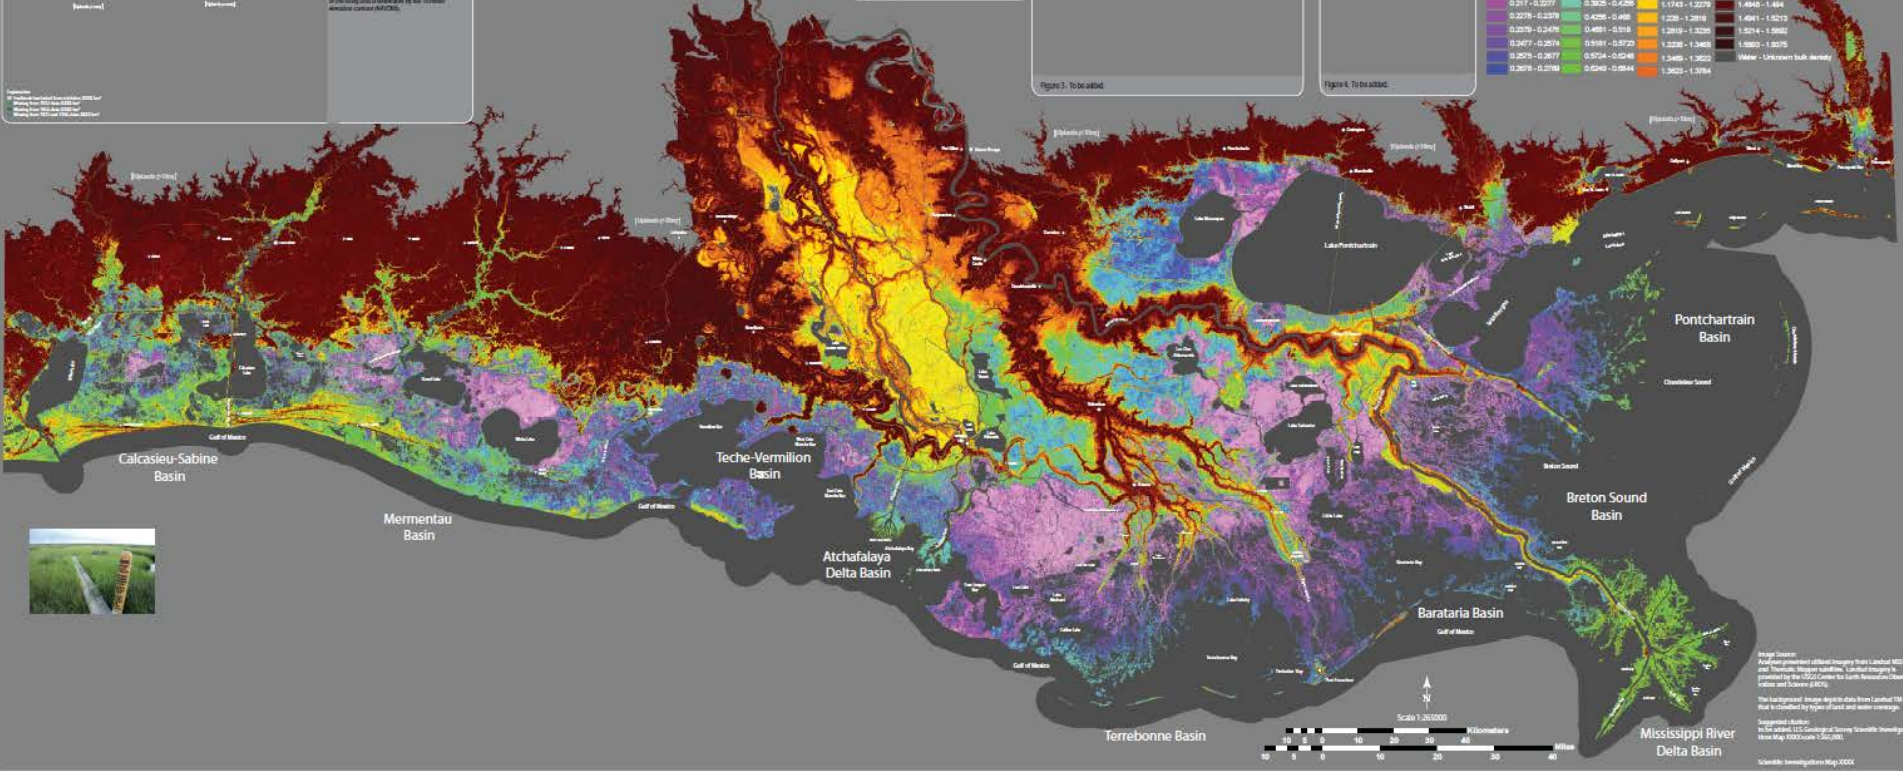

## Estimated Bulk Density (0-24 cm) in the northern Gulf of Mexico:

DRAFT

By State/MSD:

State/MSD	Estimated Bulk Density (g/cm <sup>3</sup> )
Alabama	0.0001 - 0.001
Arkansas	0.0081 - 0.12
California	0.1201 - 0.14
Colorado	0.1401 - 0.17
Connecticut	0.1701 - 0.1918
Delaware	0.1919 - 0.2048
Florida	0.2049 - 0.2188
Georgia	0.2189 - 0.2277
Idaho	0.2278 - 0.2376
Illinois	0.2377 - 0.2516
Indiana	0.2517 - 0.2617
Iowa	0.2618 - 0.2718
Kansas	0.2719 - 0.2718
Kentucky	0.0001 - 0.001
Louisiana	0.0081 - 0.12
Maine	0.1201 - 0.14
Massachusetts	0.1401 - 0.17
Michigan	0.1701 - 0.1918
Minnesota	0.1919 - 0.2048
Mississippi	0.2049 - 0.2188
Missouri	0.2189 - 0.2277
Montana	0.2278 - 0.2376
Nebraska	0.2377 - 0.2516
Nevada	0.2517 - 0.2617
New Hampshire	0.2618 - 0.2718
New Jersey	0.0001 - 0.001
New Mexico	0.0081 - 0.12
New York	0.1201 - 0.14
North Carolina	0.1401 - 0.17
North Dakota	0.1701 - 0.1918
Ohio	0.1919 - 0.2048
Oklahoma	0.2049 - 0.2188
Oregon	0.2189 - 0.2277
Pennsylvania	0.2278 - 0.2376
Rhode Island	0.2377 - 0.2516
South Carolina	0.2517 - 0.2617
South Dakota	0.2618 - 0.2718
Tennessee	0.2719 - 0.2718
Texas	0.0001 - 0.001
Utah	0.0081 - 0.12
Vermont	0.1201 - 0.14
Virginia	0.1401 - 0.17
Washington	0.1701 - 0.1918
West Virginia	0.1919 - 0.2048
Wisconsin	0.2049 - 0.2188
Wyoming	0.2189 - 0.2277

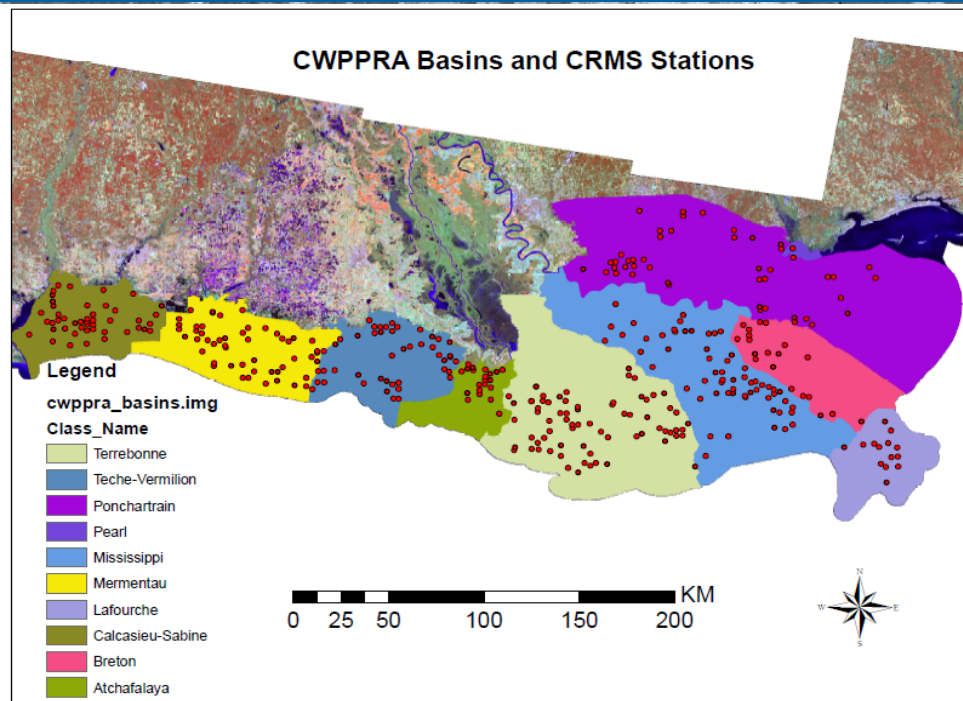

Bulk Density layer developed from a combination of CRMS core data for wetlands, and SSURGO bulk density data for areas not represented by CRMS. Tested against calibrated OM%/BD layer.

# Calibration and Validation Data

- CRMS 2006-2010 soil data (to 24 cm depth): bulk density, OM%, mineral matter %, pore space;
- CRMS 2006-2010 soil data: accretion (feldspar) and elevation (SET)
- CRMS 2007-2010 hydrology data (salinity and inundation)
- CRMS 2007 marsh type classification and dominant species
- USDA SURRGO Soils (Soil type, bulk density and OM%)
- LCA S&T Task II 2006-2007 data (~50cm depth): BD, OM%, OC%, accretion
- Historic Cesium cores (accretion since 1963)

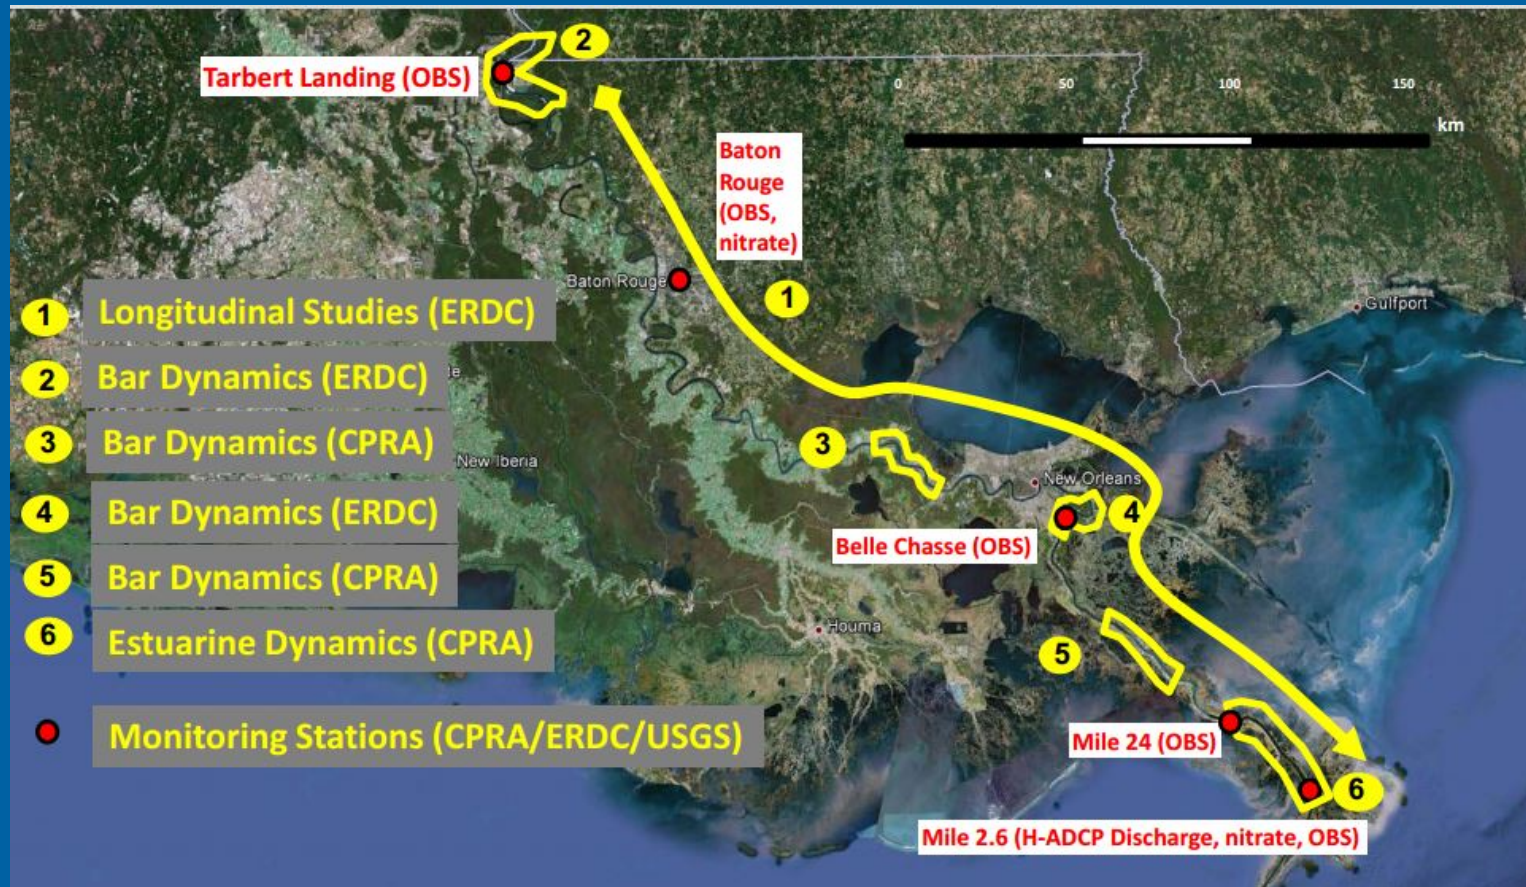

# Targeted Research to Address Critical Uncertainties & Advance Models

How much sediment delivered by freshwater diversions will accrete on marsh surfaces and will it be sufficient to keep pace with rising sea levels?

# MS River Hydrodynamic Study

Allison et al.

Collaborators: (Water Institute of the Gulf, ERDC, USGS)

Better understand hydrodynamic & sediment transport processes in river to address questions such as “At what discharge do sands stay in suspension and are they available for restoration?”

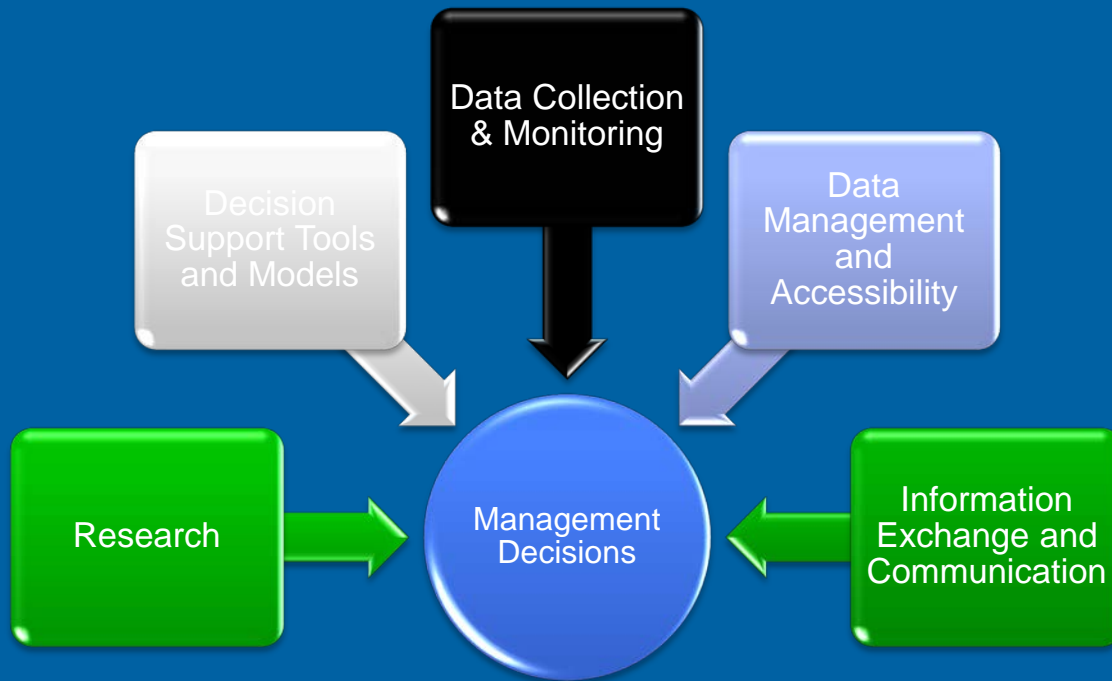

# Sediment Deposition and Trapping Efficiency Study Snedden et al.

Collaborators: (ERDC, Univ. of Texas, LSU)

- 1) How do canopy hydrodynamics and particle characteristics interact to determine if conditions are favorable for deposition, transport or erosion, and how do these conditions vary in time (hours to weeks to months) and space (tens of meters)?
- 2) Are inundation events driven by certain processes more prone to promote deposition and accretion than others (river vs. tidal vs. meteorological)? Are some more prone to promote erosion?
