Dr. Santos has been leading the horticultural program at Gulf Coast Research Center since 2005. His program concentrates on irrigation methods and Fertilization programs for vegetable and small fruit. During the past few years there has been an emphasis on Protected Agriculture, high tunnels that extend the growing seasons in Florida, and much of this research is developed with the small farmer in mind. Each year in March a small farms workshop is conducted at the center. More information on Dr. Santos and his research can be found at GCREC.ifas.ufl.edu.
